Stem cell therapy in hair transplantation

In stem cell treatment, a 3 mm punch biopsy sample is taken from the patient's own scalp sample and the person's own stem cells are produced in the GMP laboratory. The average duration is 4-6 weeks. At the end of this period, after various quality control tests, two doses of 50 million are applicated intradermally to the scalp in the problematic areas of the person in 8-10 ml of a special solution. Preferably, during application PRP support is used which makes the application more succesfull thanks to this combination.

Why Liv Hospital?

Hair transplantation is a serious operation. In order to achieve the image you dream of, cultivation must be carried out by an experienced team of specialist doctors and nurses in the hospital environment. Before and after planting, there are important points to be taken into consideration. So cultivation should be done in hospitals in a sterile environment. However, it should be kept in mind that the auxiliary health personnel other than the doctor should also be very experienced.

Get the image you dreamed of
